

ABSTRACT OF THE DISCLOSURE

A sheet package (9) to be set in a sheet storage unit (6, 106) of a printer (1) for supplying the printer with sheets comprises includes a stack of sheets (7) and a package member (8) covering the stack of sheets. ~~When the sheet package (9) is set in the printer (1), the sheets (7) are supplied from the sheet package (9) to the printer (1) along a sheet feed direction.~~ The sheets are supplied from the sheet package to the printer along a sheet feed direction. The package member (8) has a side part (53) spreading ~~in being~~ in parallel with the sheet feed direction and having an edge at its front in the sheet feed direction. ~~On a side wall of the sheet storage unit (6, 106), a pressing member (41) for pressing a side face of the stack of sheets (7) is formed in order to align the stack of sheets (7) in a direction orthogonal to the sheet feed direction.~~ The side part (53) places the package member at a proper position in the sheet storage unit (6, 106) in regard to the sheet feed direction by letting the edge make contact with the pressing member (41). The side part is structured so that a projecting part of the sheet storage unit secures the position of the package member by contacting the front edge of the side part and the side edge of the stack of sheets when the package member is placed in the sheet storage unit relative to the sheet feed direction
